

the Ohře Basin

fauna and flora

The Svatos Rocks

Common Bream

is a European species of freshwater fish in the family Cyprinidae. The bream eats water plants and plankton as well. It is widespread round the world and it is bred like a sport fish. The bream is usually 30 to 55 centimeters long. The world record is 95 cm and 10kg.

The Ohře Flow

Nowadays all flows are passable and quite stable. The main flow has the level of a water surface about 50 cm and the tributaries have about 13 cm. The average volume flow rate at the mouth is 37.94 m³/s.

Geological places of interest

The river Ohře goes through The Ore Mountains which were the part of so called Czech Massive. There can be found roofing slate deposits with granite veins. The Mostecká and Sokolovská Basins with lignite deposits were created during The Tertiary. The basaltic quarry near a small town Blatná; the basaltic vein Boč and the quarry Hřebečná are considered as interesting geological places.
